### PROCESS

Drying is often a vital step in the initial stages of limestone processing. Limestone dryers, or rotary dryers, are utilized when subsequent manufacturing steps require a reduction in moisture in order to precondition the material. Calcium Products sought a rotary dryer for that very purpose.

The dryer, 7' x 50' (2.1 x 15.2m) in size, was used to reduce the limestone’s moisture before grinding and pelletizing. We have worked with Calcium Products on a variety of additional projects throughout the years.
